

SATELLITES ON FIRE

Wildfires are no longer seasonal. They are burning more than twice the land they did 20 years ago.

The U.S. is already deploying these systems, but **in Latin America, no one's doing it.**

We built Satellites on Fire **to stop fires before they spread**, through a wildfire **early alert system** and analytics platform that combines satellites providing imagery every 5 minutes, tower-mounted cameras, weather forecasts and proprietary AI models that are detecting fires **hours faster than NASA.**
